LOSS OF ECAM COMPONENTS
18.80  OPERATION WITH ECAM PARTIALLY OR TOTALLY INOPERATIVE
GENERAL

- The Electronic Centralized Aircraft Monitor (ECAM) provides:
  - Audio warnings for failures and other conditions requiring crew action/attention.
  - Automatic analysis of aircraft systems failures and required procedures.
  - Systems information and procedures on two display units.
- The ECAM minimizes the need for the crew to frequently scan the system panels:
  - Monitoring of temporarily used items is performed on the MEMO page.
  - Routine system monitoring is performed by checking the System Display (system pages).
  - A system page is available for each of the main aircraft systems. The most suitable system page for the actual flight phase is automatically displayed.
  - The ECAM constantly monitors system parameters to provide early notification to the crew if any monitored parameter drifts out of its normal range (Advisory mode).
- Processing of aircraft systems data by the ECAM system is fully automatic.

ECAM DISPLAYS

- The ECAM interfaces with the flight crew via the following procedure-related and system-related pages:
  - MEMO page:
    The MEMO page recalls the list of systems which are selected for temporary use.
    ![MEMO Page](image1)
    - ENG ANTI ICE ON
    - SEAT BELTS ON
    - NO SMOCKING ON
    - TAT: -20°C T. FUEL: 30.2 1000
  - Warning page:
    The warning page displays the list of required actions and information related to system failures:
    ![Warning Page](image2)
    - ENG 1 FIRE
    - THROTTLE 1.......IDLE
    - FUEL LEVER 1.......OFF
    - FIRE HANDLE 1.......PULL
    - 1ST AGENT..............DISCH
    - IF FIRE AFTER 30 S:
      - 2ND AGENT..............DISCH
      - LAND ASAP
  - STATUS page:
    The STATUS page provides additional information, cross-reference to the QRH procedures and systems status reminder:
    ![STATUS Page](image3)
    - LANDING CONFIG: 20/20
    - PROC-L/G GRAVITY EXT
    - GREEN HYD SYS INOP
    - SLATS SLOW
    - FLAPS SLOW
- **System page**:

System pages provide schematics of each of the major aircraft systems. System pages are displayed automatically or can be manually selected:
FLIGHT WARNING COMPUTERS (FWC)

- The ECAM system is driven by two Flight Warning Computers (FWC).
  - Each FWC acquires and processes the aircraft systems data and generates the warning indications and system status data.
  - The two FWC also activates:
    - Audio warnings,
    - The MASTER CAUTION and MASTER WARNING lights,
    - The stick shaker,
    - Autoflight System warnings.
  - Each FWC has the capability to acquire
    - 100% of the red warnings (emergency conditions),
    - 50% of the amber cautions (abnormal conditions).

ECAM SYMBOL GENERATOR UNITS (SGU)

- 2 Symbol Generator Units (SGU) process the output data from the FWC, System Data Analog/Digital Converter (SDAC), ADC and Fuel Quantity Indication System (FQI) for presentation on ECAM.
  - The SGU's also process the output data of optional equipment (as applicable) for display of the related information on ECAM.
  - SGU 1 drives the left CRT and SGU 2 drives the right CRT.

SYSTEM DATA ANALOG-TO-DIGITAL CONVERTER (SDAC)

- The SDAC converts analog aircraft sensor data to the digital format required by the two FWC and other onboard computers.
- A cross-talk data bus enables each FWC to process the 50% amber cautions acquired by the second FWC.
- The loss of one FWC:
  - does not affect the red warnings,
  - affects part of the amber cautions (local warning lights, as applicable, are not affected).

Mod: 5051
Mod: 5051
WARNING LEVELS

• ECAM messages are divided into four levels, as follows:

RED WARNINGS

• Red warnings are associated with emergency conditions, and are identified by a red local warning light and by a Continuous Repetitive Chime (CRC), or other specific audio warnings.

• Immediate crew action must be initiated.

AMBER CAUTIONS

• Amber cautions are associated with abnormal conditions, and are identified by an amber warning light and a Single Chime (SC) audio warning.

• Immediate crew action is not required. However, time and situation permitting, these cautions should be considered without delay to prevent any further degradation of the affected system.

AMBER ALERTS

• Amber alerts correspond to conditions which only require crew monitoring, and are identified by an amber local warning light with no audio alert.

• Amber alerts are provided primarily for failures which cause the loss of system redundancy.

INFORMATION

• Additional information is provided in blue, green or white.

PRIORITY RULES

• Red Warnings have priority over Amber Cautions, which in turn have priority over Amber Alerts.

• Messages are ranked by importance so that, if more than one malfunction occur at the same time, the most important information is presented first.

PRIMARY FAILURES

• A primary failure is an equipment failure which results in the loss of one or more additional equipment or system.

For example, the loss of ADC 1 is a primary failure, resulting in the loss of:

- PITCH TRIM 1,
- YAW DAMPER 1,
- AP 1,
- ADC information on captain's instruments.

SECONDARY FAILURES

• Secondary failures are caused by primary failures.

• In the above example, the loss of PITCH TRIM 1, YAW DAMPER 1, AP 1, and of ADC information on the captain's instruments are secondary failures caused by the primary failure of the ADC 1.

INDEPENDENT FAILURES

• An independent failure affects an isolated piece of equipment or system without affecting other equipment (e.g. : a fuel TK PUMP LO PR alone).
**ECAM CRT COLOR CODES**

- The following colors are used on the ECAM CRTs:

<table>
<thead>
<tr>
<th>Color</th>
<th>Left CRT</th>
<th>Right CRT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red (R)</td>
<td>Emergency</td>
<td>Emergency</td>
</tr>
<tr>
<td>Amber (A)</td>
<td>Abnormals</td>
<td>Abnormals</td>
</tr>
<tr>
<td>Cyan (B) (Blue)</td>
<td>Actions to be taken by crew</td>
<td>Units (°C, PSI, ...)</td>
</tr>
<tr>
<td></td>
<td>Limitations to be applied by crew (Speed increments, Landing Distance factors)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>QRH procedures to be applied, in addition to ECAM actions. crew</td>
<td></td>

<td>Not Used</td>
</tr>
<tr>
<td></td>
<td></td>
<td>STATUS message</td>
</tr>
</tbody>
</table>

**COCKPIT PANEL LIGHTS**

**LOCAL WARNINGS**

- The annunciator lights on the cockpit systems panels are called local indications or local warning lights.

- Local warning lights provide independent indications of system failures/faults.

Local warning lights are activated directly by the affected equipment and remain available when the associated ECAM warning is inhibited or if the ECAM system is partially or totally inoperative.

**LIGHTS OUT CONCEPT**

- In normal, operation, all local indication lights are extinguished except green flowbars and digital fuel quantity indications.

- The following colors are used for the cockpit annunciator lights:

<table>
<thead>
<tr>
<th>COLOR</th>
<th>MEANING</th>
</tr>
</thead>
<tbody>
<tr>
<td>WARNING</td>
<td>Red Emergency condition requiring immediate crew action</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Amber Abnormal condition not requiring immediate crew action</td>
</tr>
<tr>

<td>Green Normal system operation</td>
</tr>
<tr>
<td></td>
<td>Blue Normal but temporary use of a system (e.g.: APU AVAIL)</td>
</tr>
<tr>
<td></td>
<td>White Switch is not in normal position (e.g.: OFF, ALTN)</td>
</tr>
</tbody>
</table>

Mod : 5051
ECAM WARNINGS INHIBITION

• To prevent the activation of ECAM warnings during critical flight phases (unless otherwise warranted), most ECAM warnings are inhibited:
  - during takeoff and landing,
  - in accordance with a flight-phase-related inhibition, defined for each individual warning (refer to the ECAM WARNING LOGIC page of each individual system description).

• The following ECAM warnings are never inhibited:
  - Engine or APU fire,
  - Engine failure,

• The warning inhibition can be cancelled by pressing the RCL pushbutton on the ECAM Control Panel. This enables the ECAM warning pages and audio warnings to be available.

• When TO or LDG INHIB (inhibition) is active, if a warning is still being inhibited 60 seconds after the malfunction occurred, the warning inhibition is automatically cancelled.
The following typical flight profile identifies 12 flight phases used to define the flight-phase-related inhibition of ECAM warnings.

- Flight Phase 1: ELEC PWR ON
- Flight Phase 2: SECOND ENGINE START
- Flight Phase 3: LIFT OFF
- Flight Phase 4: 1000Ft
- Flight Phase 5: 1000Ft TOUCH
- Flight Phase 6: 5 MINUTE
- Flight Phase 7: PWR ENGINE OFF
- Flight Phase 8: DOWN AFTER SEC START
- Flight Phase 9: 70Kt
- Flight Phase 10: 400Ft
- Flight Phase 11: 70Kt ENGINE SHUT DOWLIFT OFF
- Flight Phase 12: FIRST ENGINE T.O PWR APPLICATION +1 MINUTE OR 400FT WHATEVER IS FIRST ACHIEVED
- Flight Phase 13: SECOND ENGINE SHUT DOWN

Mod: 6269
ECAM WARNING OR CAUTION
PRESENTATION

- When a system malfunction is detected by one FWC, the ECAM system simultaneously generates three types of warnings:
  - Audio warning:
    An audio alert sounds in the cockpit loudspeakers to attract the flight crew’s attention:
  - MASTER WARNING and MASTER CAUTION lights:
    The relevant light illuminates to provide visual confirmation of the abnormal or emergency condition.
  - CRT information:
    Required ECAM actions, ranked by priority, and STATUS information are displayed on the left hand CRT:

    - System pages associated with the warning pages are displayed on the right hand CRT.

    Note: The system page must be checked to confirm that the warning is correct and, after completion of ECAM actions, to review the resulting system condition.

    Note: Warning and Caution presentations have priority over all other CRT displays. However, after the Warning or Caution is displayed, any system page can be manually selected.

SUMMARY

Type of Warning  | Where
---|---
1 Audio alert:  | Cockpit Loudspeakers
  - CRC for Emergencies (red warnings)
  - Single Chime for Cautions (amber cautions)
2 CRT Information:  | LH ECAM CRT
  - Warning and STATUS pages
  - Affected System pages
3 Visual alerts | MASTER WARNING and MASTER CAUTION lights

WARNING PAGES

- General:
  - The title of a warning page is consistent with the title of the associated Quick Reference Handbook (QRH) section where the QRH procedure is located.

    Note: If the warning page displays a "HYD" procedure, refer to in the "HYD" section of the QRH to review the associated QRH procedure.

  - Wording and abbreviations used on warning pages are consistent with the overhead panel.
CREW COORDINATION

• When all ECAM actions under a particular warning page title are completed, the CLR pushbutton must be pressed but, only after cross-checking with the PF (refer to the introductions of FCOM chapters 2.04.10 – Emergency procedures – and 2.05.10 – Abnormal procedures – for crew coordination procedures).

ADDITIONAL WARNING PAGES

• After the first warning page has been cleared, the subsequent pages display the procedures related to additional failures, if any.

• If a warning is cleared while being displayed, the associated warning page is also cleared (e.g. if an ENGINE FIRE warning is cleared by setting the throttle lever to idle, the ENGINE FIRE warning page is cleared from the LH CRT).

USE OF QUICK REFERENCE HANDBOOK (QRH) PROCEDURES

• Refer to QRH 0.01 and 0.02.
T.O. CONFIGURATION TEST AND T.O. WARNING

- Refer to the section 1.09.50 for detailed description of the T.O. CONFIG test and T.O. warning.

AUDIO WARNINGS

- Several types of audio warnings are provided:

<table>
<thead>
<tr>
<th>AUDIO WARNING</th>
<th>ACTIVATED BY</th>
<th>CANCELLED BY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Chime (SC)</td>
<td>Amber cautions</td>

<td>Cabin Call</td>
<td>No cancel required</td>
</tr>
</tbody>
</table>

Mod : 4801 + 5051
Warning Logic

- The following schematics provides a typical warning logic, as illustrated in the description of each individual system.

**Fault Condition**  
**Local Indication(s)**  
**ECAM Warning**

1. **Pitch Trim 1 (Or 2) Off**
   - **Pitch Trim System 1 Or 2 Fault (Or Off)**
   - **Pitch Trim 1 (Or 2) Off**
   - **ECAM Warning**

2. **Pitch Feel 1 (Or 2) Fault**
   - **Pitch Feel Sys 1 (Or 2) Fault (Or Off)**
   - **Pitch Feel 1 (Or 2) Fault**
   - **ECAM Warning**

3. **Pitch Trim 1 Off**  
   **Pitch Trim 2 Off**
   - **Pitch Trim System 1 And 2 Fault (Or Off)**
   - **Pitch Trim 1 And 2 Off**
   - **ECAM Warning**

4. **Pitch Feel 1 Off/R**  
   **Pitch Feel 2 Fault**
   - **Pitch Feel Control System 1 And 2 Fault (Or Off)**
   - **Pitch Feel 1 And 2 Fault**
   - **ECAM Warning**

5. **Pitch Feel In Hi Speed**
   - **Pitch Feel Disagree**
   - **Pitch Feel Sys 1 Fault**
   - **Pitch Feel Sys 2 Fault**
   - **Pitch Feel In Hi Speed**
   - **ECAM Warning**

**ECAM Automatic Flight Phase Inhibition**

- **Elec Pwr On**  
- **Second Engine Start**  
- **First Engine T.O. Power**  
- **70Kt**  
- **400Ft**  
- **400Ft**  
- **70Kt**  
- **First Engine Shut Down**  

Mod: 5051
ECAM DISPLAY UNITS (CRTs)

LEFT CRT

- The left CRT displays:
  - Red/Amber warning pages, or
  - The STATUS or MEMO page.

RIGHT CRT

- The right CRT displays system pages.

MASTER LIGHTS

(1) Red Warning flashing light (pushbutton)
- Require immediate crew action.
- In the event of a red warning, pressing the MASTER WARNING light extinguishes both MASTER WARNING lights and cancels the aural warning. This action has no effect on CRT messages.

(2) Amber Warning lights (pushbutton)
- Action may be delayed, as required.
- In the event of an amber caution pressing either R MASTER CAUTION light extinguishes both MASTER CAUTION lights and cancels the aural warning. This action has no effect on CRT messages.

Mod : 5051
ECAM CONTROL PANEL

The ECAM control panel enables the crew to:

- Switch ECAM CRTs on or OFF and to adjust the ECAM CRT brightness,
- Manually select system pages,
- Manually select the STATUS page,
- Clear warning pages with the CLR push-button,
- Review the completed warning pages using the RCL (Recall) push-button,
- Switch the Symbol Generator Units (SGUs) On or OFF.

(1) Brightness adjustment knobs
- Used to switch On/OFF and adjust the brightness of each CRT display.

(2) Symbol Generator Unit (SGU) pushbutton
- Amber FAULT light illuminates if an SGU failure is detected.
- Pressing the affected push-button turns off the associated SGU. FAULT extinguishes and the white OFF light illuminates.
- Both CRT's are then driven by the remaining SGU.

(3) System pages selection keys
- Pressed to manually select a system page for review on the right CRT.
  When a key is pressed, the key illuminates white.
- A manually selected system page can be deselected by pressing its illuminated pushbutton a second time.
- In single CRT mode (i.e. with one CRT failed), system pages can only be manually selected when the MEMO page is displayed. (All warning pages and the STATUS page must have been cleared first).
- If a warning or advisory occurs, the associated system page automatically replaces any manually selected page.

(4) CLR (Clear) pushbutton
- Illuminates white when a warning page or the STATUS page is displayed.
- Each press clears one warning page or the STATUS page from the display.
- Extinguishes when the MEMO page is displayed (No more warning pages or STATUS pages remaining).

(5) STS (Status) pushbutton
- When the MEMO page is displayed, pressing the STS pushbutton enables to manually select the STATUS page.
- If the STS pushbutton is pressed when no STATUS message exists, a STATUS NORMAL message is displayed.
- STATUS messages are not automatically displayed before the second engine start or after the first engine shutdown.
- If a warning occurs while the STATUS page is displayed, the applicable warning page replaces the STATUS page.

(6) RCL (Recall) pushbutton warning
- Pressing this pushbutton displays, in sequence, all the warning pages that have been cleared.
- If the RCL pushbutton is pressed when no failures exist, a NORMAL message appears.
- Pressing the RCL pushbutton also cancels the ECAM warning inhibition until the end of the present flight phase.
This enables the ECAM to activate visual and audio warnings for malfunctions which are inhibited in the present phase of flight.
AUDIO CANCEL PANEL

- An audio interface provides audio alerts through the aircraft loudspeakers.

- Audio warnings can be cancelled using:
  - The NORM audio cancel pushbutton,
  or
  - The safety-wired EMER audio cancel switch.

(1) NORM AUDIO CANCEL Pushbutton

Pressing the NORM AUDIO CANCEL pushbutton cancels all audio warnings, except the following:

- LANDING GEAR NOT DOWN
- TO. CONFIG
- OVERSPEED
- STALL
- TCAS
- GPWS or EGPWS
- STAB IN MOTION
- ALTITUDE ALERT

*Note*: These audio warnings can only be cancelled by use of the EMER AUDIO CANCEL switch.

(2) EMER AUDIO CANCEL WARNING SYS pushbutton

- This safety wired and guarded switch can be used to cancel all audio red warnings which cannot be canceled using the NORM CANCEL pushbutton and which produce an operational nuisance.

- When EMER AUDIO CANCEL function has been used, the related red aural warning inhibition is automatically canceled when related warning failure condition disappears. Then if same warning activation conditions reappears, the red aural warning is triggered again.

- The EMER CANCEL ON message appears on ECAM when EMER AUDIO CANCEL switch is used and no ECAM warning activated.

---

**CAUTION**

If a failure occurs while the Emer Cancel push button is depressed, the associated audio warning (red warning) or the associated audio warning and ECAM warning (amber warning) will not be triggered.

- ECAM messages are displayed to indicate that the specific warning which has been cancelled, (e.g. APU FIRE WARNING CANCELLED).

- Cancellation can be removed by pressing the RCL pushbutton on the ECAM control panel for more than 3 seconds.

- Cancellation is automatically reset when the electric power is initially applied to the aircraft, or after the first engine shutdown.

Mod: 5051
MANUAL SELECTION OF SYSTEM PAGES:

- Any system page (except the CRUISE page) can be displayed on the right CRT by pressing the associated key on the ECAM control panel.

  The selected key illuminates.

- If an advisory or system failure occurs when a system page is manually displayed, the page related to the system affected by the advisory or failure automatically replaces the selected system page.

SYSTEM DISPLAY

- The selected system page is displayed on the right ECAM CRT.

SYSTEM PAGES

- The following system pages can be selected by pressing the corresponding key on the ECAM control panel:

<table>
<thead>
<tr>
<th>Key</th>
<th>Page Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENG</td>
<td>ENGINE</td>
<td>Engine secondary parameters</td>
</tr>
<tr>

</tr>
<tr>
<td>WHEEL</td>
<td>WHEEL</td>
<td>Brakes and ground spoilers information</td>
</tr>
</tbody>
</table>

- The following flight phase related system page is also available:

  ENG START:

  - The ENG START is similar to the ENG page, but the lower left indicating scale is replaced by a BLEED pressure indication.
SYSTEM DISPLAY INDICATIONS

- When in their normal ranges all digital values and analog indications are green. When an indication reaches its warning level, the associated analog pointer and digital value become amber (abnormals) or red (emergencies).
- In case of loss of sensor electrical power or loss of signal, the associated indication is replaced by an amber "XX".

Note 1: All units (e.g. °C, PSI, V, Hz, etc...) are displayed in cyan.

Note 2: System page titles:

When a system page is displayed automatically (except by advisories) the page title is green.

If a system page is manually selected, or displayed by an advisory, its title is white.

PUMP and VALVE SYMBOLS

SYSTEM PAGE COLOR CODING

<table>

</tbody>
</table>
CRUISE PAGE

- The CRUISE page is automatically displayed when in clean configuration or when both throttle levers are retarded below takeoff power, if no other system page is displayed.

1. STATIC AIR TEMPERATURE
2. CABIN ALTITUDE
3. ZONE NAME
4. ZONE TEMPERATURE
5. BULK CARGO COMPARTMENT TEMP
6. ENGINE N2 VIBRATION
7. ENGINE N1 VIBRATION
8. OIL QUANTITY
9. FUEL FLOW
NORMAL DISPLAY MODE

• When both ECAM CRT's are operating and:
  - no warning is activated,
  - no advisory is activated,
  - no system page is manually selected,
the ECAM operates in the flight-phase-related mode.

• The MEMO page is displayed on the left CRT to recall the list of systems which have been selected (and are normally operated only temporarily).

• The right CRT displays the flight-phase-related system page (for example the CRUISE page, as illustrated hereafter).

Mod : 5051
MEMO PAGE

- The MEMO page is the basic display of the left ECAM CRT.

- This page lists the systems or functions which have been selected for temporary use.

- The MEMO page is displayed when:
  - No warning page is displayed, and
  - The STATUS page is not displayed.

  **Note:** If a warning page is displayed, when it is cleared, if no STATUS page message exist, the MEMO page is displayed. If there is a STATUS page, the MEMO page will be displayed when the STATUS page is cleared.

- The MEMO page always displays:
  - The TAT,
  - The Total fuel quantity (T. FUEL),
  - A magenta STATUS message is displayed in the upper right corner if there are messages on the STATUS page,
  - A magenta TO INHIB or LDG INHIB message is displayed in the upper left corner during takeoff and landing phases. This indicates that most non-critical ECAM warnings are being inhibited.

- The messages displayed on the MEMO page are listed here after:
  - CAB PRESS MAN CTL (only with electrical pressurization system, per Mod 3881),
  - IRS IN ALIGN,
  - TAT IN ICING RANGE,
  - ENG ANTI ICE ON,
  - WING ANTI ICE ON,
  - APU RUNNING,
  - CONTINUOUS RELIGHT ON,
  - SEAT BELTS ON,
  - NO SMOKING ON,
  - FUEL FEED MAN CTL,
  - CTR TANK FEEDING,
  - FUEL X FEED,
  - PARKING BRAKE ON,
  - EXT PWR CONNECTED,
  - SPD BRAKES EXTENDED (flashes if throttles above IDLE),
  - LDG LIGHT EXTENDED,
  - ECON FLOW SELECTED,
  - FWD/BULK CARGO COOLING ON, if Mod 3448 installed.

Eng. : PW ALL or GE 80C2
MEMO PAGE (Cont’d)

- T.FUEL : XX.X Kg (Lbs) x 1000 (lower right corner of the CRT),
- TAT : XXX°C (°F) (lower right corner of the CRT),
- GW : XXX.XX Kg (Lbs) x 1000 (right bottom of the CRT), only if Mod 4801 fitted,
- CG : XX.X % (left bottom of the CRT), only if Mod 4801 or Mod 4541 fitted,
- TOW : XXX.XX Kg (Lbs) x 1000 (right bottom of the CRT), only if Mod 4541 fitted,
- FUEL TEMP : XXX°C (°F) (right bottom of the CRT), only if Mod 5875 fitted,
- ZFW : XXX.X Kg (Lbs) x 1000, only if 6536 fitted,
- ZFCG : XX.X %, only if 6536 fitted.
**FLIGHT-PHASE-RELATED PAGES**

</table>

Mod : 6269
The following typical flight profile summarizes the flight phases defined for:
- the system display flight-phase-related mode,
- the warnings flight-phase inhibition.

Mod: 6269
GENERAL

- If a system parameter is trending out of its normal range, but has not reached its warning threshold, the ECAM activates the Advisory mode.

- The activation of the Advisory mode results in the automatic display of the system page related to the affected system and parameter.

- No audio warning is associated with the Advisory mode.

- The activation of the Advisory mode is inhibited on the ground, and until slats have been retracted after takeoff.

• On the ECAM control panel, the associated system key illuminates.

  Pressing the key cancels the Advisory mode display:
  - the system key extinguishes,
  - the system display reverts to the flight-phase-related page.

(1) ADV (Advisory) message

- An attention-getter message (ADV) is displayed after the system page title and flashes white until the page is deselected, by pressing the associated key on the ECAM control panel.

- The affected parameter is still displayed in green but is pulsing.
WARNING PAGE PRESENTATION

PRIMARY FAILURES
• The name of the primary failure is boxed.

SECONDARY FAILURES
• The title of the system affected by secondary failures is identified with an asterisk.

INDEPENDENT FAILURES
• Independent failures are displayed without asterisk or boxed items.

• If an independent failure occurs while secondary failures are displayed, a flashing green CLEAR message is displayed at the bottom of the warning page if there is not enough space on the CRT to display the new warning:

• When the CLR pushbutton is pressed on the ECAM control panel, the new warning is displayed on the next warning page.
**ACTION FEEDBACK**

- When a blue ECAM action is performed, the action feedback is displayed on the warning page to confirm that the action is complete.

*Note: Action feedback is largely generated by the SDAC. Thus, if the SDAC is lost (component failure or loss of AC BUS 1) most action feedback is lost.*

**RED WARNINGS**

- When an ECAM action is performed, the associated line disappears:

  **BEFORE THROTTLE 1...IDLE**

  **AFTER THROTTLE 1...IDLE**

  THROTTLE 1...IDLE has been cleared. The next action is now in the first line.

**AMBER CAUTIONS**

- For amber cautions, when the action is performed, the line turns white:

  **BEFORE ACTION**

  **AFTER ACTION (GEN 1 OFFa)**

  Entire line turns white to confirm action feedback

- If a system which has been set to OFF/R is successfully reset, the affected warning page is cleared from the warning display and the MEMO or STATUS page is displayed.
CONDITIONAL ACTIONS

- Some warning pages include conditional action steps (e.g.: IF RAPID DECOMPRESSION, in the EXCESS CAB ALT procedure) which require the crew to decide whether to perform the related action(s) or not:

  **CABIN ALT**
  - EXCESS CAB ALT
  - OXY MASK: ON
  - DESCENT: AS RRD
  - IF RAPID DECOMPRESSION:
  - EMER DESCENT: PERFORM
  - ATC: INFORM
  - IGNITION: CONT RELIGHT
  - TRANSponder: AS RDD

PROC: EMER DESCENT

Note: There is no action feedback for conditional action steps. Whether the actions are performed or not, the corresponding action lines remain displayed in blue.
The STATUS page is displayed after all warning pages are cleared to provide a summary of the aircraft's condition:

- Land ASAP message, if applicable,
- Landing Category capability downgrade, if applicable,
- Speed and altitude limitations,
- Configuration recommendations, landing speed increments and landing distance multiplication factors,
- Emergency or Abnormal procedures which require reference to a QRH Procedure (PROC: - - - - - ),
- Systems / functions lost or degraded,
- Additional information related to systems operation.

The STATUS page provides the following information or references:

- Automatically:
  - When all warning pages have been cleared from the warning display.

  **Note 1:** If there are no STATUS messages, this page is skipped, and the MEMO page is displayed directly.

- Manually:
  - From the MEMO page, the STATUS page can be displayed by pressing the STS pushbutton.

  When the STATUS page has been manually selected the CRL pushbutton must be pressed to return to the MEMO page.

  **Note:** If there are no status messages, NORMAL is displayed on the STATUS page as long as the STS pushbutton is pressed. When released, the MEMO page is displayed.
SYSTEM DISPLAY

- When in their normal ranges all digital values and analog indications are green. When an indication reaches its warning level, the associated analog pointer and digital value become amber (abnormals) or red (emergencies).

- In case of loss of sensor electrical power or loss of signal, the associated indication is replaced by an amber "XX".

**Note 1:** All units (e.g. °C, PSI, V, Hz, etc...) are displayed in cyan.

**Note 2:** System page titles:

When a system page is displayed automatically (except by advisories) the page title is green.

If a system page is manually selected, or displayed by an advisory, its title is white.

PUMP and VALVE SYMBOLS

- **PUMP ON**
- **PUMP OFF**
- **VALVE OPEN**
- **VALVE CLOSED**
- **LO PUMP ON AND LO PR**

ECAM SEQUENCE FOR INDEPENDENT FAILURES:

1) When warning is detected:
   - Applicable (red or amber) warning page is displayed
   - Associated system page is displayed
   - MASTER lights: Applicable light illuminates flashing.*
   - ECAM Control Panel: CLR pushbutton illuminates
   - Local Warning light: FAULT light is illuminated
   - Audio Warning is activated*

2) When crew performs required actions:
   - Action feedback is indicated on warning page:
     - amber warning page: action step line turns white
     - red warning page: Line is cleared from display
   - System page provides confirmation on the results of ECAM actions
   - MASTER lights extinguished
   - ECAM Control Panel: CLR pushbutton is still illuminated
   - Local Warning light: extinguished
   - Audio Warning: cancelled

3) When crew presses CLR pushbutton on ECAM control panel to clear the warning page:
   - STATUS page is displayed
     - Required QRH procedures are listed
     - Applicable limitations/restrictions are provided
   - The flight-phase-related system page is displayed
   - MASTER lights: extinguished
   - ECAM Control Panel: CLR pushbutton still illuminated if information on STATUS page
   - Local Warning light: extinguished
   - Audio Warning: cancelled

4) When crew presses CLR pushbutton on ECAM control panel to clear the STATUS page:
   - MEMO page is displayed
   - No Change
   - MASTER light: extinguished
   - ECAM Control Panel: CLR light extinguishes
   - Local Warning light: extinguished
   - Audio Warning: cancelled

5) If the ECAM control panel RCL pushbutton is pressed to review the warning page procedures:
   - Warning pages are displayed in the same order as originally activated
   - Associated system pages are displayed in sequence with warning pages
   - MASTER lights: Applicable lights remain extinguished
   - ECAM Control Panel: CLR pushbutton illuminates
   - Local Warning light: is extinguished unless failure is still present
   - Audio Warning: cancelled

Note: If a warning page is automatically cleared when the corrective actions are performed (e.g.: resetting a tripped Yaw Damper lever), the associated WLDP and CLR lights extinguish.

* Until either MASTER light is pressed.

Mod: 5051
LEFT BLANK INTENTIONALLY
ECAM SEQUENCE FOR PRIMARY AND SECONDARY FAILURES:

1) When warning is detected:
   - Applicable primary (red or amber) warning page is displayed
   - Associated system page is displayed
   - MASTER lights: Applicable lights illuminate flashing*
   - ECAM Control Panel: CLR pushbutton illuminates
   - Local Warning light: Primary and Secondary FAULT lights illuminate
   - Audio Warning is activated*

2) When crew performs required actions for primary failure:
   - Action feedback is indicated on warning page
   - Red warning page: line is cleared from display
   - Amber warning page: action step line turns white
   - System page provides confirmation on the results of ECAM actions
   - MASTER lights: the light remain extinguished
   - ECAM Control Panel: CLR pushbutton is still illuminated
   - Local Warning light: Primary FAULT light extinguished/Secondary FAULT light illuminated, Audio Warning: Cancelled

3) When crew presses CLR pushbutton to clear primary warning page:
   - Applicable secondary (red or amber) warning page(s) are displayed
   - System page associated with the first secondary warning page is displayed
   - MASTER lights: the lights remain extinguished
   - ECAM Control Panel: CLR pushbutton is still illuminated
   - Local Warning light: Primary FAULT light extinguished/Secondary FAULT light illuminated, Audio Warning: Cancelled

4) When crew performs required actions for secondary failure(s):
   - Action feedback is indicated on warning page
   - Amber warning pages: action step line turns white
   - System page provides confirmation on the results of ECAM actions
   - MASTER lights: the lights are extinguished
   - ECAM Control Panel: CLR pushbutton is still illuminated
   - Local Warning lights: extinguished
   - Audio Warning: cancelled

5) When crew presses CLR pushbutton to clear secondary warning pages (until STATUS page is displayed):
   - Other secondary warning pages are displayed until the STATUS page is reached
   - Required QRH procedures (PROC) are indicated
   - Applicable limitations/restrictions are listed
   - System pages associated with other secondary warning pages are displayed until STATUS page is displayed
   - When the flight phase related system page is displayed
   - MASTER lights: extinguished
   - ECAM Control Panel: CLR pushbutton is still illuminated
   - If information on STATUS page
   - Local Warning lights: extinguished
   - Audio Warning: Cancelled

* Until either MASTER light is pressed.

Mod: 5051
ORDER OF EVENTS and INDICATIONS FOR PRIMARY AND SECONDARY FAILURES (continued):

6) When crew presses CLR pushbutton on ECAM control panel to clear the STATUS page:

- **L CRT**: MEMO page displayed
- **R CRT**: No Change

- **MASTER lights**: lights remain extinguished
- **ECAM Control Panel**: CLR light extinguishes
- **Local Warning lights**: extinguished
- **Audio Warning**: cancelled

7) If the ECAM control panel RCL pb is pressed to review the WD pages:

- **L CRT**: Warning pages are redisplayed in the same order as originally displayed.
- **R CRT**: Associated system pages are displayed in sequence with warning pages

- **MASTER light**: Applicable lights illuminate
- **ECAM Control Panel**: CLR pushbutton illuminates
- **Local Warning lights**: illuminate if failures are still present
- **Audio Warning**: cancelled
SINGLE FWC LOSS

Note: The loss of one FWC can be caused by the loss of the AC BUS 2 or the AC EMER Bus.

- If one FWC is lost:
  - ECAM cannot provide warning pages for any Amber Cautions/Alerts,
  - The remaining FWC can still activate the MASTER CAUTION warning for part of amber faults.
  - Red warnings are not affected as all red warning signals are received by both FWCs.
  - MASTER CAUTION light illuminates (1),
  - CLR pushbutton illuminates (2),
  - The lost amber cautions may only be identified by monitoring the local indications on the systems panels (3).

Note: Some types of action feedback are lost.

- The MASTER CAUTION light is cancelled by pressing the pushbutton.
- When the CRL pushbutton is pressed:
  - The CLR pushbutton light extinguishes (4),
- The warning pages displays the message:
  FWS AMBER FAULT ... MONITOR SYS above the MEMO page (5).

For all amber cautions, no ECAM warning page is available on the left CRT.

The paper check-list (QRH) must be used, in conjunction with local indications.

The ECAM message:
FWS AMBER FAULT ... MONITOR SYS indicates the loss of a single FWC.
Should the message subsequently become:
FWS FAULT ... MONITOR SYS, this would indicate the loss of the second FWC (and the loss of all ECAM and audio warnings).

Mod : 5051
LOSS OF BOTH FWC

- If the second FWC is lost (e.g. loss of AC BUS 2 and AC EMER BUS or loss of one bus and loss of the non-related FWC), the only indication is that the word “AMBER” is cleared from the MEMO page message.

R
- MASTER CAUTION light illuminates.
- The warning page displays the message:
  FWS FAULT ................. MONITOR SYS
- No ECAM warnings are available.
- No audio, or CRT warnings are available.
- Overhead panel and other local indications must be scanned more frequently.

SUMMARY OF EFFECTS OF SINGLE AND DUAL FWC LOSS

<table>
<thead>
<tr>
<th>AMBER WARNINGS</th>
<th>RED WARNINGS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ONE FWC LOST</strong></td>
<td><strong>BOTH FWC LOST</strong></td>
</tr>
</tbody>
</table>
| - All amber warning pages are lost.  
  - Paper checklists (QRH) must be used for amber cautions and alerts.  
  - 50% of ECAM amber warnings are lost (Only local indications are available).  
  - For the remaining 50% ECAM amber warnings, only the Audio Chime warnings are available (no warning page). | - All ECAM warnings are lost.  
  - Local warning lights must be monitored.  
  - All red and amber warning pages are lost.  
  - No Audio warning or MASTER CAUTION/WARNING light is available.  
  - QRH procedures must be used for all fault conditions. |

- No effect, except that action feedback may be lost.

Mod : 5051
FWC 1 AND 2 - AUDIO MODULE FAILURE

- If case of loss of the FWC audio modules no aural warnings are available.
- The MASTER CAUTION light illuminates.

- The associated warning page is displayed on the left CRT.
- The MASTER CAUTION lights extinguish when either light is pressed.
- This warning is cleared by pressing the CLR pushbutton:

R • The left CRT displays the message:
FWS AURAL FAULT
above the MEMO page.
LOSS OF SYSTEM DATA ANALOG-DIGITAL CONVERTER (SDAC)

- In case of SDAC failure, or loss of electrical power (AC BUS 1/AC ESS BUS), the following ECAM functions are lost:
  - MEMO page messages,
  - Most ECAM action feedback,
  - All system pages (except FUEL QTY on the FUEL page and indications on WHEEL page),
  - Some STATUS messages are also lost.

- With no aircraft system failures:
  - Messages on MEMO page and on system display indicate that data are lost (except Fuel Quantity on FUEL page).

  ![MEMO Page](image1)
  ![System Data Not Available](image2)

- If an aircraft system failure occurs (e.g.: GEN FAULT):
  The associated warning page is displayed, but action feedback is not provided, the message NO ACTION FEEDBACK ON CRT indicates that action feedback will not be displayed when action steps are performed.

  ![No Action Feedback On CRT](image3)
  ![System Data Not Available](image4)

Mod : 3781
LOSS OF SYMBOL GENERATOR UNIT (SGU)

- If case of an ECAM SGU failure or loss of electrical power (AC BUS 1 OFF for SGU 1 and AC BUS 2 OFF for SGU 2), the associated SGU FAULT light illuminates on the ECAM control panel, and a white diagonal line is displayed on the affected CRT.

The affected SGU pushbutton's FAULT light illuminates on the ECAM control panel.

A white diagonal line is displayed on the affected CRT.

The affected SGU is switched OFF by pressing the associated pushbutton switch.

The affected display returns to normal operation.

- After the affected SGU is switched OFF, the ECAM CRTs return to normal operation (the remaining SGU supplies both CRTs).
**LOSS OF A SINGLE CRT**

- In case of CRT failure or loss of electrical power (L CRT – AC BUS 1, R CRT – AC BUS 2) the display is blanked.

- The affected CRT must be switched OFF.

- The remaining CRT then provides all normal functions, as follows.

- With no warnings or cautions present, the MEMO page is display on the operative CRT:
  - All system pages can be manually selected (except the CRUISE page).

- If an ECAM warning or caution occurs, the warning pages replace the MEMO page on the operative CRT:
  - the related system page can be selected after clearing all the warning pages and the STATUS page,
  - after reviewing the system page, pressing the CLR pushbutton redisplays the first warning page.

* WITHOUT AIRCRAFT SYSTEM FAILURE:

- L CRT OFF

* WITH AN AIRCRAFT SYSTEM FAILURE:

- L CRT OFF
LOSS OF BOTH ECAM CRTs

- In case of double CRTs failure or loss of electrical power supply (e.g. AVIONICS SMOKE drill or FLIGHT ON BAT ONLY), the ECAM still provides:
  - Audio warnings, and
  - MASTER CAUTION/WARNING lights and local warnings.
